If you have any queries, comments, suggestions, complaints or reviews..Visceral leishmaniasis: epidemiology, clinical features and treatment. The epidemiology, clinical features and treatment of visceral leishmaniasis (VL) has been reviewed. VL has been reported from all regions of the world, including the New World and Africa. All species of leishmanial parasite, including *L. infantum*, *L. braziliensis* and *L. donovani* are known to cause VL. In North America, dogs and humans are the major reservoirs. In the Mediterranean region, goats are the major reservoir, with dogs playing a minor role. In Latin America, dogs and various species of wild and domestic mammals are important reservoirs. The annual incidence of VL varies from 20,000 to 200,000 cases/year, of which more than 90% occur in the Mediterranean region. In India, Nepal, Bangladesh and the Middle East, an estimated 20,000 to 40,000 cases occur annually. The annual incidence of VL in the Middle East has been increasing for many years. The incidence is highest in rural areas, where malnutrition is common. The incubation period is usually between 10 and 12 days. The incubation period is longer in children, in whom the main mode of transmission is by sandflies. All organs and systems can be involved. The most common clinical presentation is fever, generalised lymphadenopathy and hepatosplenomegaly. Hepatosplenomegaly and fever occur in 95% of patients with VL, and generalised lymphadenopathy in 60% of patients. Splenomegaly is the most reliable clinical criterion for the diagnosis of VL. The disease is highly fatal unless treated appropriately. The most important criterion for diagnosis is the presence of amastigote forms of leishmanial parasites in splenic smears. Tissue culture is usually used as a confirmatory test. Treatments include antimicrobial agents alone or in combination with anti-leishmanial drugs. Treatment with anti-leishmanial drugs alone is usually not curative, although with combination therapy (medication with anti-leishmanial drugs and a rifampicin-containing drug), cure rates of 50 to 100% have been achieved.Reduced in vitro cartilage degradation by 82157476af
